

Global AI Adoption Report 2024

Trends, Challenges & Strategic Opportunities

QueryMind Research Division · June 2024

142

Countries
Surveyed

8,400+

Respondents

73%

YoY Growth
in Adoption

\$1.8T

Projected
Market 2028

EXECUTIVE SUMMARY

Artificial Intelligence has crossed the threshold from experimental technology into a core business driver for organisations worldwide. This report synthesises survey data from 142 countries and in-depth interviews with 380 C-suite executives to provide the most comprehensive view of enterprise AI adoption to date.

Key findings indicate that 73 % of large enterprises now run at least one production AI workload, up from 42 % in 2022. Investment is accelerating: global enterprise AI spend reached \$412 billion in 2023 and is forecast to surpass \$1.8 trillion by 2028.

Generative AI, in particular, has moved from pilot projects to revenue-generating products in under 18 months · the fastest technology transition recorded in our longitudinal dataset.

Despite this momentum, significant friction remains. Talent scarcity, data governance gaps, and regulatory uncertainty are the top three barriers cited by respondents. Organisations that have successfully scaled AI share three common practices: centralised data infrastructure, executive-led AI strategy, and robust model governance frameworks.

Key Regional Findings

Region	Adoption Rate	AI Spend 2023	Top Use-Case	Top Barrier
North America	87 %	\$198B	LLMs & Automation	Talent, Cost
Europe	71 %	\$112B	Compliance AI	Regulation, Privacy
Asia-Pacific	68 %	\$89B	Manufacturing AI	Infrastructure
Middle East	54 %	\$31B	Smart Cities	Data Quality
Latin America	41 %	\$18B	AgriTech AI	Connectivity
Africa	28 %	\$7B	HealthTech AI	Talent, Funding

Top Barriers to AI Adoption (All Regions)

Analyst Insight

Organisations that invested in internal AI academies reduced their time-to-production by 34 % compared to those relying solely on external hiring. Upskilling existing talent remains the most cost-effective strategy for mid-market firms entering AI at scale.

Strategic Recommendations

1 Build a Unified Data Foundation

Before scaling AI, audit and consolidate data silos. Organisations with centralised data lakes report 2.4× faster model deployment. Prioritise data quality over quantity.

2 Establish an AI Governance Office

Create a cross-functional body responsible for model risk, ethics review, and regulatory compliance. This reduces post-deployment incidents by up to 67 % based on survey data.

3 Invest in Explainability Tooling

Customer-facing AI applications require interpretable outputs. Adopt SHAP, LIME, or vendor-native explainability layers before production launch, not as an afterthought.

4 Pilot Generative AI in Low-Risk Workflows

Internal knowledge management and code assistance are ideal entry points. They deliver measurable ROI within 90 days without customer-facing compliance exposure.

5 Partner for Compute, Own the Model

Leverage cloud GPU marketplaces for training bursts while retaining model weights and fine-tuning pipelines internally. This balances cost efficiency with IP protection.

Conclusion

AI adoption is no longer optional for competitive organisations. The window for experimentation has closed; execution is now the differentiator. Firms that move decisively · building governance structures, upskilling talent, and deploying production-grade models · will compound their advantages exponentially over the next three to five years. Those that delay risk falling into a capability gap that becomes structurally difficult to close.
